

You're invited:

RE-electrification, repowering our world with renewables

Electrification of our transportation, utility and building sectors is a vital component of our society's move toward a cleaner and greener world. So how are we doing? Where do we stand today with the many initiatives involved in transitioning from the carbon producing forms of energy to more sustainably generated renewable forms of electricity.

RENEW Energy Initiative invites you to join us for the first in a three-part series exploring the **RE-ELECTRIFICATION of our world**. In this first series will look at the **Transportation** sector and review some local and national initiatives helping to transition traditional fossil-fueled transportation methods over to cleaner renewables. Our panel includes the following:

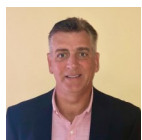

Mal Skowron—of the Green Energy Consumers Alliance will provide and update on The Transportation and Climate Initiative (TCI)

Scott Avedisian—CEO of RIPTA—Scott will share an overview of the Electrification progress for RI buses

Heidi Krantz—of EVgo—will update us on the adoption of electric vehicles and the proliferation of charging stations.

Russ Maymon—President of REI will moderate the discussion and introduce our panel of experts

In only 60 minutes, you will have the opportunity to hear from and ask questions of the people involved in reducing emissions and transitioning our **Transportation** sector over to cleaner, more sustainable, and renewable forms of power!
